

Supplementary Table S4. Model Card for the DFS Prediction Model.

Item	Description
Model name	DFS Prediction Tool-v1.0
Intended use	To predict 5-year DFS in patients with stage I non-squamous NSCLC after curative resection, and to assist in estimating potential ACT benefit.
Target population	Patients with stage I non-squamous NSCLC who underwent lobectomy with standard lymph node dissection.
Data source	Multicenter retrospective cohort: derivation cohort (N=1481, 2015-2019), external validation cohort (N=591).
Modeling method	Variable selection via univariable Cox, multivariable Cox, and LASSO. Six ML algorithms tested (Decision Tree, Logistic Regression, MLP, Xgboost, SVM, Random Forest). The best-performing model (Xgboost) was selected.
Performance	Internal validation: AUC = 0.95, External validation: AUC = 0.93.
Limitations	Developed in Asian multicenter cohorts, external generalizability to other populations require further validation. Imaging and molecular features were not included. Predictions should not replace clinical judgment.
Availability	Online calculator [https://dfs-prediction.shinyapps.io/shiny_dfs_model/], model code with R/Python versions and model data can be acquired by contacting the corresponding author.
